MEMORANDUM

TO: Recreation Department
Town of Wayland
66 River Road
Wayland, MA 01778

FROM: Samuel W. Gregorio, P.E., PTOE **PROJECT NO.:** T0558.16
Douglas S. Halpert, E.I.T.
Eric R. Paquette, E.I.T.

RE: Traffic Assessment – Proposed Trout Brook Road Recreational Field

TEC, Inc. has been retained by The Town of Wayland to perform a Traffic Assessment associated with a proposed recreational field at a property located on Trout Brook Road in Wayland, Massachusetts. The proposed recreational field includes an 11v11 soccer field (130 yards x 110 yards), a 34-space parking lot, and a pathway connecting to the existing Farrar Pond Trail network.

TEC has evaluated the traffic operations for the study area intersections under existing and future conditions. The future year planning horizon examines traffic operations under existing conditions (2017), as well as a five-year design horizon (2022) for traffic-volume projections, which includes an evaluation of the no-build conditions (without the proposed project) and build conditions (with site traffic added). These conditions are compared to determine what, if any, additional off-site mitigation is necessary to provide reasonable traffic operations in the area after the project is complete.

EXISTING CONDITIONS

The study area was selected to contain the major roadways providing local access to the project site. The following intersections were included in the study area:

1. Oxbow Road / Trout Brook Road (safety review only)
2. Oxbow Road / Campbell Road / Farrar Road (safety review only)
3. Concord Road (Route 126) / Oxbow Road
4. Sherman's Bridge Road / Oxbow Road / Alpine Road

The study area intersections are shown graphically in Figure 1.

Geometry

A comprehensive field inventory of existing traffic conditions at the study area intersections was conducted by TEC staff in January 2017 to obtain information related to intersection geometry and lane use. The field investigation consisted of an inventory of existing roadway geometrics, operating characteristics, and safety characteristics. A description of the existing roadway and intersection inventory is provided below.

Page 3 of 19

Intersections

Oxbow Road / Trout Brook Road

Trout Brook Road intersects Oxbow Road to form a three-legged, unsignalized intersection. Each intersection approach provides a single 11-foot wide general-purpose lane with separation of directional flow unmarked. The Trout Brook Road southbound approach operates under STOP-control while the Oxbow Road eastbound and westbound approaches operate under free-flow conditions. Pedestrian accommodations are not provided.

Oxbow Road / Campbell Road / Farrar Road

Campbell Road and Farrar Road intersect Oxbow Road to form a four-legged, unsignalized intersection. Each intersection approach provides a single 10-foot to 12-foot wide general-purpose lane with separation of directional flow unmarked. The Oxbow Road eastbound approach operates under free-flow conditions while all other approaches operate under STOP-control. Pedestrian accommodations are not provided.

Concord Road (Route 126) / Oxbow Road

Oxbow Road intersects Concord Road (Route 126) to form a three-legged, unsignalized intersection. Each intersection approach provides a single 11-foot wide general-purpose lane. Directional flow along Concord Road is separated by a double-yellow centerline while separation of directional flow along Oxbow Road is unmarked. The Oxbow Road eastbound approach operates under STOP-control while the Concord Road northbound and southbound approaches operate under free-flow conditions. A five-foot sidewalk and variable-width grass buffer are provided along the easterly side of Concord Road.

Sherman's Bridge Road / Oxbow Road / Alpine Road

Oxbow Road and Alpine Road intersect Sherman's Bridge Road to form a four-legged, unsignalized intersection. Each intersection approach provides a single 9.5-foot to 12-foot wide general-purpose lane with separation of directional flow unmarked. The Alpine Road northbound approach and the Oxbow Road southbound approach operate under STOP-control while the Sherman's Bridge Road eastbound and westbound approaches operate under free-flow conditions. Pedestrian accommodations are not provided. The Oxbow Road southbound approach splits at a landscaped island. The easterly split has a faded STOP-bar striped on the roadway; however, "DO NOT ENTER" signage along the southbound approach diverts vehicles to the westerly leg of the split.

Existing Traffic Volumes

To establish existing traffic-volume conditions at the study area intersections, manual Turning Movement Counts (TMCs) were conducted at the Concord Road (Route 126) / Oxbow Road study area intersection during the weekday afternoon (2:00 PM – 5:00 PM) peak period on Thursday, January 19, 2017. A detailed summary of the turning movement counts, partitioned

Town of Wayland

Traffic Assessment – Proposed Trout Brook Road Recreational Field

March 14, 2017

Page 4 of 19

into 15-minute intervals, is provided within Attachment A. Additional TMCs were conducted at the Sherman's Bridge Road / Oxbow Road / Alpine Road intersection during the weekday evening (4:00 PM – 5:00 PM) peak period on Thursday, February 2, 2017. These counts are also provided within Attachment A.

In addition, Automatic Traffic Recorder (ATR) counts were conducted along Oxbow Road, just west of Kettlehole Road, from Wednesday, January 18, 2017 through Tuesday, January 24, 2017 concurrently with the TMCs to gather a continuous week of daily traffic-volume data. A summary of the weekday ATR traffic data is presented in Table 1. A detailed summary of the ATR data, partitioned into one-hour intervals, is provided within Attachment B.

Table 1 – Existing Weekday Traffic Volume Summary

Location	Weekday Traffic Volume ^(a)	Weekday Morning Peak-Hour			Weekday Evening Peak-Hour		
		Traffic Volume ^(b)	K Factor ^(c)	Directional Distribution ^(d)	Traffic Volume	K Factor	Directional Distribution
Oxbow Road (west of Kettlehole Road)	521	60	11.5	80.0% EB	56	10.7	64.3% WB

^a Daily traffic expressed in vehicles per day

^b Hourly traffic expressed in vehicles per hour

^c Percent of daily traffic volumes which occurs during the peak-hour

^d Percent of peak-hour volume in the predominant direction of travel

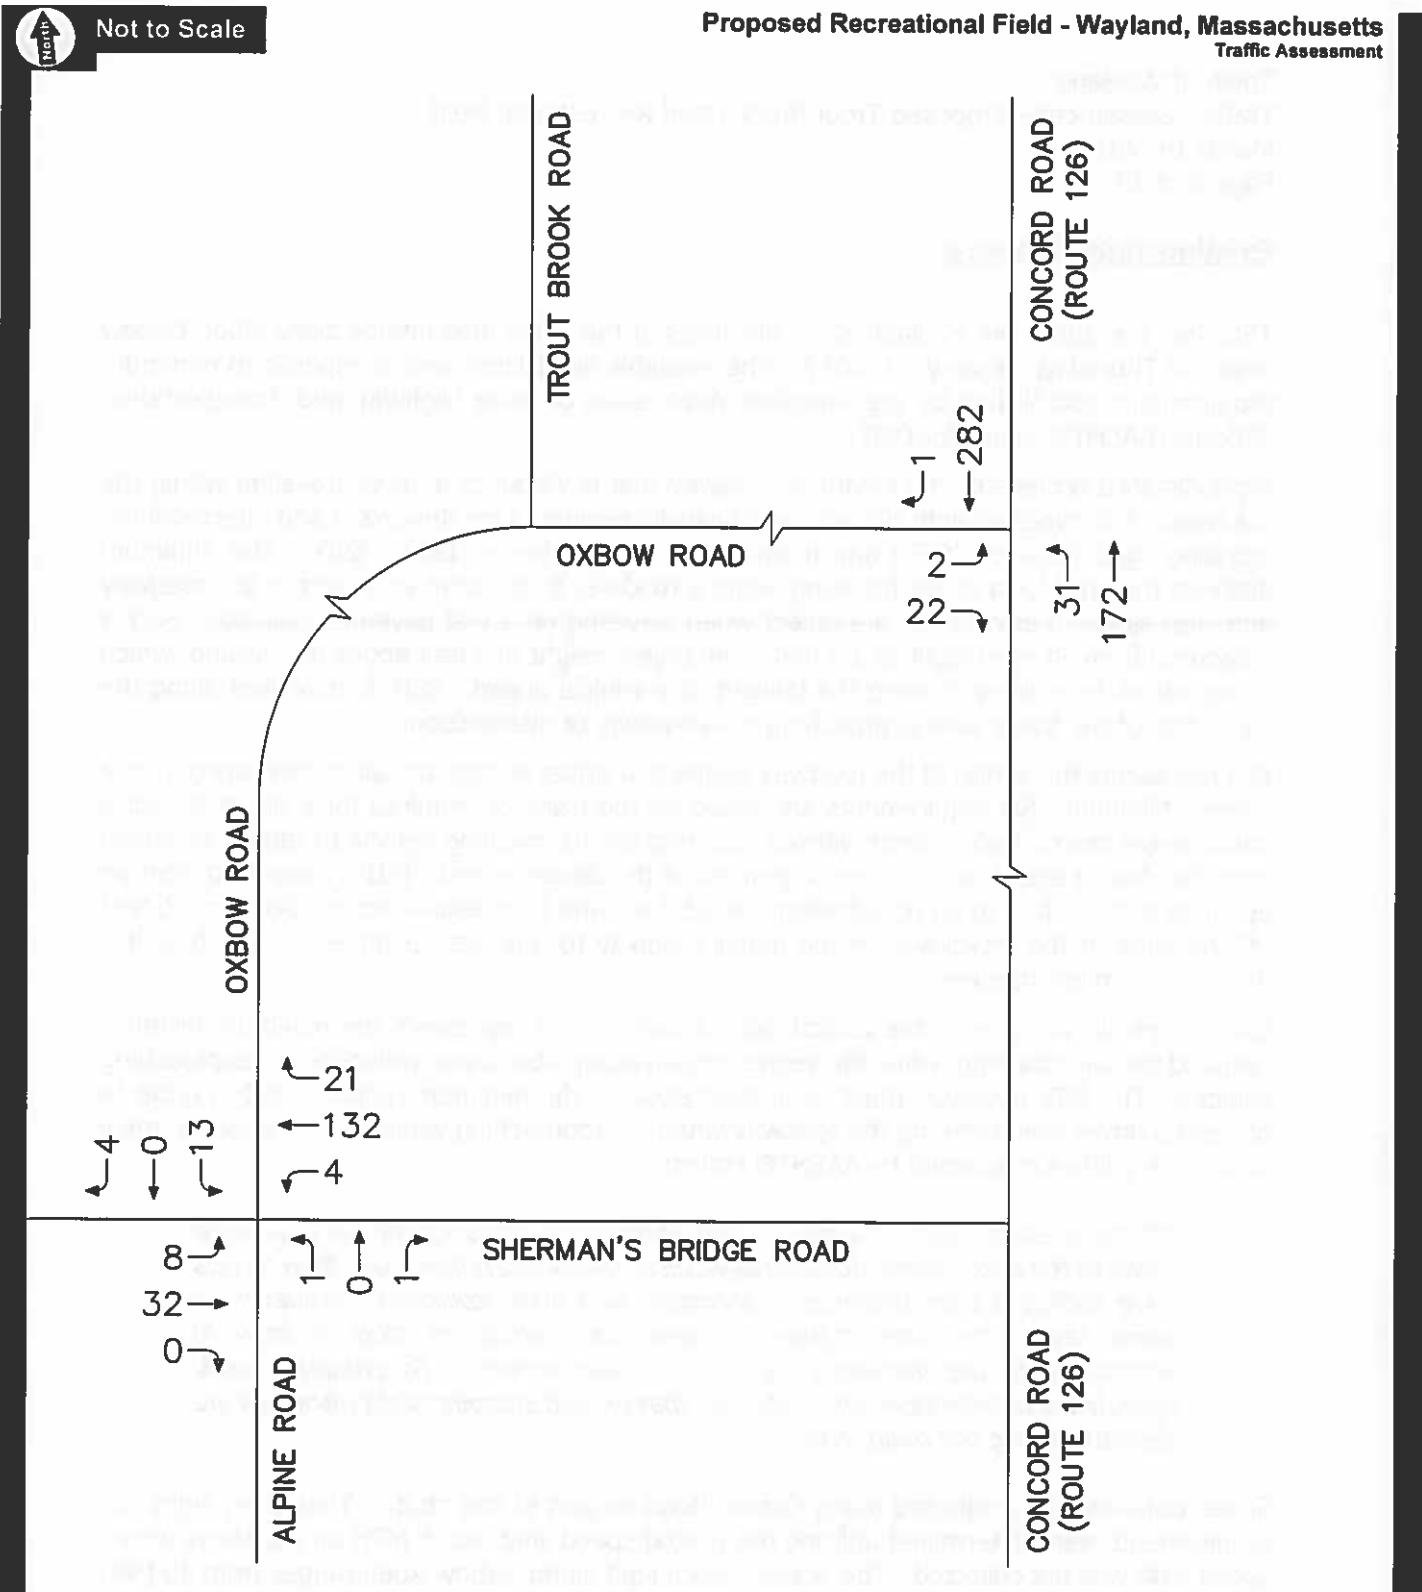

Seasonal Adjustment

In accordance with MassDOT standards, traffic volumes are typically adjusted to average-month conditions. Based on a review of historic traffic-volume counts collected by MassDOT at a permanent count station along Route 2 in Concord¹ and along Interstate 95 in Lexington², traffic volumes in January are 4.2 percent lower than average-month conditions. Therefore, the January 2017 traffic volumes were upwardly adjusted by 4.2 percent to reflect average-month conditions. The compiled seasonal adjustment data is provided in Attachment C. The resulting 2017 Existing weekday evening peak-hour traffic-volume network is illustrated in Figure 2.

Town of Wayland

Traffic Assessment – Proposed Trout Brook Road Recreational Field

March 14, 2017

Page 6 of 19

Existing Sight Distance

TEC, Inc. measured the available sight distances at the study area intersections along Oxbow Road on Thursday, January 12, 2017. The available sight lines were compared to minimum requirements established by the American Association of State Highway and Transportation Officials (AASHTO) and MassDOT.

Sight distance represents the length of roadway that is visible to a driver traveling within the roadway. Two types of sight distance are typically evaluated for driveways and intersections: stopping sight distance (SSD) and intersection sight distance (ISD). SSD is the minimum distance required for a driver traveling along a roadway to perceive an object in the roadway and stop safely in advance of the object when traveling on a wet pavement surface. SSD is measured from an eye height of 3.5 feet to an object height of 2 feet above the ground, which is equivalent to a driver viewing the taillight of a vehicle ahead. SSD is measured along the centerline of the travel lane approaching the driveway or intersection.

ISD represents the length of the roadway visible to a driver waiting to exit a driveway or minor street. Minimum ISD requirements are based on the distance required for a driver to exit a minor street onto a major street without requiring an approaching vehicle to reduce its speed from the design speed to less than 70 percent of the design speed. ISD is measured from an eye height of 3.5 feet to an object height of 3.5 feet, and is measured from a distance 15 feet off the edge of the travel-way of the major roadway to represent a driver waiting to exit a driveway or minor roadway.

SSD is typically considered the critical sight distance, as it represents the minimum distance required for safe stopping, while ISD represents an acceptable speed reduction for approaching vehicles. The ISD, however, must be at least equal to the minimum required SSD in order to prevent a driver from entering the roadway when an approaching vehicle is too close to safely stop. The guidance provided by AASHTO states:

"If the available sight distance for an entering or crossing vehicle is at least equal to the appropriate stopping sight distance for the major road, then drivers have sufficient sight distance to anticipate and avoid collisions. However, in some cases, this may require a major-road vehicle to stop or slow to accommodate the maneuver by a minor-road vehicle. To enhance traffic operations, intersection sight distances that exceed stopping sight distances are desirable along the major road."

Speed data was only collected along Oxbow Road as part of this study. Therefore, sight line requirements were determined utilizing the posted speed limit plus 5 MPH on roadways where speed data was not collected. The posted speed limit along Oxbow Road ranges from 20 MPH to 25 MPH. Table 2 provides a comparison of the available sight lines to AASHTO's recommended minimum sight distances.

Town of Wayland

Traffic Assessment – Proposed Trout Brook Road Recreational Field

March 14, 2017

Page 7 of 19

Table 2 – Existing Sight Distance Measurements

Approach / Direction	Posted Speed	Measured Speed	AASHTO Minimum	Measured (FT)	
				Intersection Sight Distance	Stopping Sight Distance
Oxbow Road at Concord Road: <i>Looking North</i> <i>Looking South</i>	30 MPH	32 MPH	200 FT	360	455
	30 MPH	32 MPH	200 FT	465	>500
Campbell Road at Oxbow Road – Campbell Road NB approach: <i>Looking East</i> <i>Looking West</i>	N/A	N/A	0 FT	-	-
	20 MPH	25 MPH ^a	155 FT	100 ^b	>500
Farrar Road at Oxbow Road – Farrar Road WB approach: <i>Looking East</i> <i>Looking West</i>	N/A	N/A	0 FT	-	-
	20 MPH	25 MPH ^a	155 FT	±100 ^c	>500
Trout Brook Road at Oxbow Road: <i>Looking East</i> <i>Looking West</i>	25 MPH	30 MPH ^a	200 FT	305	365
	25 MPH	30 MPH ^a	200 FT	410	410
Oxbow Road at Sherman's Bridge Road: <i>Looking East</i> <i>Looking West</i>	25 MPH	30 MPH ^a	200 FT	390	465
	25 MPH	30 MPH ^a	200 FT	340	>500
Alpine Road at Sherman's Bridge Road: <i>Looking East</i> <i>Looking West</i>	25 MPH	30 MPH ^a	200 FT	275	465
	25 MPH	30 MPH ^a	200 FT	200 ^d	>500

N/A – sight distance criteria does not apply because that approach is stop sign controlled

^a Measured speed = posted speed + 5 MPH

^b Sight lines limited by a fence along the southerly side of Oxbow Road

^c Sight lines limited by trees along the northerly edge of Farrar Road (potential to be trimmed/removed)

^d Sight lines limited by trees and bushes along the southerly side of Sherman's Bridge Road

As shown in Table 2, the ISD and SSD at each study area intersection exceed the AASHTO and MassDOT minimum recommendations for ISD and SSD except for two (2) ISD measurements. The sight line from Campbell Road, looking west along Oxbow Road, is limited to approximately 100 feet due to a fence located along the right-of-way line. Similarly, the sight line from Farrar Road, looking west along Oxbow Road, is limited to approximately 100 feet due to an overgrown bush along the roadway; this has the potential to be trimmed or removed to restore a sight line.

TEC recommends the Town of Wayland and the Town of Lincoln consider trimming the low-lying brush to improve sight lines at the intersections. If the fence cannot be adjusted due to the proximity of the right-of-way, the Town(s) can install a stop sign on the Oxbow Road eastbound approach to create an all-way stop controlled intersection. TEC will review the intersection safety characteristics with the Wayland Police Department to determine if this will be monitored for a period post-construction before implementing a change in traffic control at this intersection.

Town of Wayland

Traffic Assessment – Proposed Trout Brook Road Recreational Field

March 14, 2017

Page 8 of 19

Time Trial Run

TEC, Inc. recorded travel times from either end of Oxbow Road to determine travel time to the site. Times were recorded at approximately 11:30 AM on Thursday, January 12, 2017 with the driver obeying the posted speed limit. Table 3 shows the time trial runs.

Table 3 – Time Trial Runs

Approach / Direction	Time
Start: <i>Oxbow Road at Concord Road</i>	0 Seconds
<i>Trout Brook Road</i>	2 Minutes 3 Seconds
<i>Oxbow Road at Sherman's Bridge Road</i>	4 Minutes 16 seconds
Start: <i>Oxbow Road at Sherman's Bridge Road</i>	0 Seconds
<i>Trout Brook Road</i>	2 Minutes 1 Second
<i>Oxbow Road at Concord Road</i>	4 Minutes 20 seconds

Table 3 shows that Trout Brook Road is located approximately half-way between both ends of Oxbow Road, indicating vehicles accessing the site will not have a strong preference for using one access point for Oxbow Road over the other. Time trial runs were performed under free-flow conditions when little to no traffic was present on the roadway, consistent with reasonable assumptions for the off-peak time periods for field use.

FUTURE CONDITIONS

Traffic volumes in the study area were projected to the year 2022, which reflects a five-year planning horizon in accordance with MassDOT standards for Traffic Assessments. The traffic conditions for the year 2022, under No-Build conditions, were developed to document the operating conditions independent of the proposed project, including all existing traffic, new traffic resulting from background growth, and traffic from specific development. Anticipated site-generated traffic volumes for the proposed recreational field were superimposed upon the No-Build traffic networks to reflect the Build conditions with the proposed project.

General Background Growth

Traffic-volume data compiled by MassDOT from permanent, spot count, and historic traffic count stations in Concord^{3,4}, Framingham⁵, Natick^{6,7}, Newton⁸, and Waltham^{9,10} along arterial commuter roadways in the vicinity of the Town of Wayland were reviewed in order to

³ MassDOT Count Station 403 – Concord – Route 2 – East of Concord Rotary

⁴ MassDOT Count Station 4003 – Concord – Route 62 – At Acton Town Line

⁵ MassDOT Count Station 4924 – Framingham – Route 135 – East of Route 126

⁶ MassDOT Count Station 4923 – Natick – Route 135 – East of Newfield Drive

⁷ MassDOT Count Station 4892 – Natick – Route 135 – West of High Street

⁸ MassDOT Count Station 6726 – Newton – Route 16 – West of Interstate 95

⁹ MassDOT Count Station 4911 – Waltham – Route 60 – West of Trapelo Road

¹⁰ MassDOT Count Station 4873 – Waltham – Totten Pond Road – West of Lexington Street

Town of Wayland

Traffic Assessment – Proposed Trout Brook Road Recreational Field

March 14, 2017

Page 9 of 19

determine traffic growth trends. Based on the MassDOT traffic-volume data, traffic volumes in the area have been increasing at a rate of 0.9 percent per year since 2005. Therefore, to provide a conservative analysis scenario, a 1.0 percent per year compounded annual background traffic growth rate was used to account for potential future traffic growth external to the study area and any presently unforeseen development. Count station data have been included in Attachment D.

Specific Development by Others

TEC coordinated with the Town of Wayland Planning Department to identify nearby private / public development projects in the vicinity of the study area that are either in the planning process or were recently approved but not yet occupied. Based on these discussions, no projects were identified as potential traffic contributors to the study area roadways.

No-Build Traffic Volumes

The 2022 No-Build weekday evening peak-hour traffic-volume network was developed by applying the 1.0 percent per year compounded annual background traffic growth rate to the 2017 Existing Conditions peak-hour traffic volumes over the five-year design horizon. The resulting 2022 No-Build weekday evening peak-hour traffic-volume network is illustrated in Figure 3.

Site Generated Trips

The project consists of constructing a recreational field to be used primarily as an 11v11 soccer field (130 yards x 110 yards) during the spring and fall seasons. The Town of Wayland is also considering striping the field for lacrosse usage during the spring and field hockey usage during the fall. TEC estimated the trips to be generated by the proposed recreational field using standard trip rates contained within the Institute of Transportation Engineers (ITE) publication *Trip Generation, 9th Edition* for Land Use Code (LUC) 488 – Soccer Complex.

The proposed project is anticipated to generate 72 new vehicle trips on an average weekday, with 2 new vehicle trips (1 entering and 1 exiting) during the weekday morning peak-hour and 18 new vehicle trips (12 entering and 6 exiting) during the weekday evening peak-hour. On a typical Saturday, 118 new vehicle trips are anticipated, with 30 new vehicle trips (14 entering and 16 exiting) during the Saturday midday peak-hour. The detailed trip generation calculation worksheets are provided in Attachment E. The resulting site-generated traffic-volume network for the weekday evening peak-hour is presented in Figure 4. Note: the volumes shown represent the likely trips generated during the traditional commuter peak hour when the adjacent roadways are operating at their highest volumes. The recreational use will generate a greater number of trips during other hours before and after the roadway's peak period, when there is more roadway capacity.

To forecast usage of the proposed recreational field, TEC researched operations at the existing 11v11 soccer field located on Alpine Road, less than 1.5 miles south of the project site. Currently, five (5) Town of Wayland soccer teams regularly utilize the field during the spring and fall soccer seasons, with practices typically held after 5:00 PM on weekdays and games

Town of Wayland

Traffic Assessment – Proposed Trout Brook Road Recreational Field

March 14, 2017

Page 10 of 19

held on Saturdays. In anticipation of lacrosse usage at the proposed recreational field, TEC also researched the practice and game schedules for the Town of Wayland lacrosse teams. Lacrosse teams typically practice two (2) times a week, with practices held after 6:00 PM on weekdays and games held on Sundays. Data for the potential field hockey usage was not available; however, it is anticipated that the times for practices and games will be similar to the soccer and lacrosse uses. From the research, TEC anticipates that the estimated trips to be generated by the proposed recreational field will occur after the traditional weekday evening peak-hour.

Trip Distribution

The distribution of weekday site-generated traffic volumes for the recreational field was based on the TMCs collected at the Concord Road (Route 126) / Oxbow Road and Sherman's Bridge Road / Oxbow Road / Alpine Road intersections. Based on the site's location along the Town of Lincoln's southerly border, it is unlikely that many trips would come from the north along Concord Road (Route 126) on weekdays as only Town of Wayland residents would be utilizing the field for weekday practices. The anticipated weekday site-generated trip distribution is presented in Table 4.

Table 4 – Site-Generated Trip Distribution

Approach / Direction	Percentage
Sherman's Bridge Road (from east)	34%
Sherman's Bridge Road (from west)	14%
Concord Road (from south)	52%

Approximately 52 percent of site-generated trips are expected to access Oxbow Road via Concord Road (Route 126) from the south. The remaining 48 percent are expected to access Oxbow Road via Sherman's Bridge Road, with 34 percent coming from the east and 14 percent coming from the west.

2022 Build Traffic Volumes

The 2022 Build Condition traffic-volume networks consist of the 2022 No-Build traffic-volumes with the addition of the site-generated traffic for the proposed residential development. The resulting 2022 Build weekday evening peak-hour traffic-volume network is presented in Figure 5.

TRAFFIC OPERATIONS ANALYSIS

Levels of Service

A primary result of capacity analyses is the assignment of level-of-service to traffic facilities under various traffic-flow conditions.¹¹ The concept of level-of-service is defined as a qualitative measure describing operational conditions within a traffic stream and their perception by motorists and / or passengers. A level-of-service definition provides an index to quality of traffic flow in terms of such factors as speed, travel time, freedom to maneuver, traffic interruptions, comfort, convenience, and safety.

Six levels-of-service are defined for each type of facility. They are given letter designations from A to F, with level-of-service (LOS) A representing the best operating conditions and LOS F representing the worst. Since the level-of-service of a traffic facility is a function of the traffic flows placed upon it, such a facility may operate at a wide range of levels-of-service, depending on the time of day, day of week, or period of year.

Intersection Queue Length Analysis

Vehicle queue analyses are a direct measurement of an intersection's ability to process vehicles under various traffic control and volume scenarios and lane use arrangements.

The vehicle queue analysis was performed using the Synchro 8.0 intersection capacity analysis software which is also based upon the methodology and procedures presented in the *2010 Highway Capacity Manual (HCM 2010)*. Synchro reports the 95th percentile queues for unsignalized intersections and both the 50th (average) and 95th percentile vehicle queues for signalized intersections, which are based on the number of vehicles that experience a delay of six seconds or more at an intersection and is a function of the traffic signal timing; vehicle arrival patterns during the analysis period; and the saturation flow rate. The 50th percentile or average vehicle queue is the average number of vehicles that are projected to be delayed by six seconds or more at the intersection under study during the analysis period. The 95th percentile vehicle queue is the vehicle queue length that will be exceeded only five percent of the time; or approximately three minutes out of 60 minutes during the peak one hour of the day. During the remaining 57 minutes, the vehicle queue length will be less than the 95th percentile queue length.

Parameters for Traffic Impact Analyses

Unsignalized Intersections

The levels-of-service of unsignalized intersections are determined by application of a procedure described in the *HCM 2010*. Level-of-service is measured in terms of average control delay. Mathematically, control delay is a function of the capacity and degree of saturation of the lane

¹¹The capacity analysis methodology is based on the concepts and procedures presented in the *Highway Capacity Manual 2010*; Transportation Research Board; Washington, DC, 2010.

group and / or approach under study and is a quantification of motorist delay associated with traffic control devices such as traffic signals and STOP signs. Control delay includes the effects of initial deceleration delay approaching a STOP sign, stopped delay, queue move-up time, and final acceleration delay from a stopped condition. Definitions for level-of-service at unsignalized intersections are also given in the *HCM 2010*. Table 5 summarizes the relationship between level-of-service and average control delay.

Table 5 – Level-of-Service Criteria for Unsignalized Intersections^a

Level-of-Service (v/c < 1.0)	Level-of-Service (v/c ≥ 1.0)	Average Control Delay (seconds per vehicle)	Description
A	F	≤10.0	LOS A represents a condition with little or no control delay to minor street traffic.
B	F	10.1 to 15.0	LOS B represents a condition with short control delays to minor street traffic.
C	F	15.1 to 25.0	LOS C represents a condition with average control delays to minor street traffic.
D	F	25.1 to 35.0	LOS D represents a condition with long control delays to minor street traffic.
E	F	35.1 to 50.0	LOS E represents operating conditions at or near capacity level, with very long control delays to minor street traffic.
F	F	>50.0	LOS F represents a condition where minor street demand volume exceeds capacity of an approach lane, with excessive control delays resulting.

^a Source: *Highway Capacity Manual 2010*, Transportation Research Board; Washington D.C.; 2010

Analysis Results

TEC analyzed traffic operations at the Concord Road (Route 126) / Oxbow Road and Sherman's Bridge Road / Oxbow Road / Alpine Road intersections, the two main access points for the proposed recreational field. The traffic to be generated by the proposed recreational field is not anticipated to have any negative effects on the operating conditions at the study area intersections. In the 2022 Build condition, all movements at the study area intersections are expected to operate at acceptable levels-of-service (LOS B or better) and with queues not normally exceeding one vehicle. The detailed Intersection Capacity and Queue Analyses results are provided in Attachment F.

PARKING ANALYSIS

Institute of Traffic Engineers (ITE) Parking Generation

To estimate the amount of parking required to meet the peak parking demand for the proposed recreational field, TEC utilized the ITE publication *Parking Generation, 4th Edition* for LUC 488 – Soccer Complex. Per a study conducted at 12 locations across the country, the average parking supply ratio for soccer complexes is 38 spaces per field, with an 85th percentile peak parking demand of 61 vehicles per field for a typical weekday. On Saturdays when soccer matches are held, the average peak parking demand increases to 59 vehicles per field, with an 85th percentile peak parking demand of 65 vehicles per field. The parking demand is typically higher on Saturdays versus weekdays because far fewer spectators come to the field for practices than for matches, and practices often include only one team per field as opposed to two teams per field during matches. This data source is expected to be conservative because it does not contemplate active parking management that could space out various events to control the parking demand.

Town of Wayland Zoning Bylaws

As specified in Section 506.1.10 in Article 198-506 Off-Street Parking of the Town of Wayland Zoning Bylaws, any land uses not accounted for in Sections 506.1.1 through 506.1.9 shall be subject to the parking recommendation supplied by the Site Plan Approval Granting Authority. Knowing this, TEC analyzed the parking provided at the nearby soccer field located on Alpine Road, less than 1.5 miles south of the project site. Approximately 26 parking spaces are provided for the Alpine Road soccer field, with the edge of Alpine Road utilized for overflow parking.

Parking Recommendation

The current conceptual plan depicts 34 proposed parking stalls. This supply of parking is appropriate when compared to the 26 parking spaces provided at the nearby Alpine Road soccer field. TEC believes the proposed parking supply should adequately accommodate the average parking demand during weekdays; however, spectators attending matches on Saturdays may be required to park along the edge of Trout Brook Road at times due to a lack of available spaces at periods between the end of one match and the start of another. The Town is also considering a potential phased construction of an additional 21 stalls if project demands warrant it. However, prior to constructing additional stalls, the Recreation Department will consider the feasibility of staggering the times between matches, significantly lowering the parking demand.

TEC recommends that the Town assess the peak parking demands for the other field during the spring 2017 soccer season prior to finalizing the parking design. In an effort to manage the parking demand, TEC recommends a 30-minute buffer between games on this field. If the overlapping parking demands for departing and arriving participants (during the transition between the two events) results in off-site parking, the buffer times can be extended by 15-minutes until there are no resultant off-site parking impacts.

CONCLUSIONS AND RECOMMENDATIONS

TEC has examined the potential traffic impacts associated with the proposed recreational field on the study area roadways. The following is a summary of the results and conclusions of this effort:

- The project consists of constructing a recreational field to be used primarily as an 11v11 soccer field (130 yards x 110 yards) during the spring and fall seasons. The Town of Wayland is also considering striping the field for lacrosse usage during the spring and field hockey usage during the fall.
- The project is anticipated to generate 72 new vehicle trips on an average weekday, with 2 new vehicle trips (1 entering and 1 exiting) during the weekday morning peak-hour and 18 new vehicle trips (12 entering and 6 exiting) during the weekday evening peak-hour. On a typical Saturday, 118 new vehicle trips are anticipated, with 30 new vehicle trips (14 entering and 16 exiting) during the Saturday midday peak-hour. These trip counts could be confirmed by the Town during any spring 2017 soccer and lacrosse activities.
- Approximately 52 percent of site-generated trips are expected to access Oxbow Road via Concord Road (Route 126) from the south. The remaining 48 percent are expected to access Oxbow Road via Sherman's Bridge Road, with 34 percent coming from the east and 14 percent coming from the west.
- The sight distance characteristics meet or exceed industry guidance at most locations. However, the sight line from Campbell Road (looking west along Oxbow Road) is limited to 100 feet due to a fence located along the roadway. Similarly, the sight line from Farrar Road, looking west along Oxbow Road, is limited due to minor brush along the roadway that can be easily cleared. TEC recommends the Town of Wayland and the Town of Lincoln consider trimming or removing some brush to improve sight lines at the intersections. Alternatively, the Towns can introduce a stop sign on the Oxbow Road eastbound approach, making it an all-way stop controlled intersection. These can be evaluated in the field with Town of Wayland Police and DPW staff.
- The traffic to be generated by the proposed recreational field is not anticipated to have any negative effects on the operating conditions at the study area intersections. In the 2022 Build condition, all movements at the study area intersections are expected to operate at acceptable levels-of-service (LOS B or better) and with queues not exceeding one vehicle. Even if the trip generation for the site increased in intensity by two or three times, it would not materially impact the capacity of the surrounding roadway system.
- TEC believes the proposed 34 parking spaces should adequately accommodate the average parking demand during weekdays. The Town should review operations after commencement of the use of the field and stagger game times if the parking demands exceed the supply of stalls as planned. If necessary, the Town can construct the supplemental 21 parking stalls in the adjacent gravel lot and perform periodic assessments to manage the intervals between successive matches or practices.

After reviewing the potential traffic impacts associated with the proposed recreational field, and performing minor vegetation removal, TEC is confident that the proposed project can be

Town of Wayland
Traffic Assessment – Proposed Trout Brook Road Recreational Field
