May 28, 2021 (Revised July 29, 2021)

Mike Staiti Keystone Development 910 Boston Post Road Suite 310 Marlborough MA 01752

RE: Wetland Resource Evaluation, 27 Sherman's Bridge Road, Wayland, Massachusetts

Dear Mike:

On May 14, 2021, EcoTec, Inc. inspected the above-referenced property for the presence of wetland resources as defined by: (1) the Massachusetts Wetlands Protection Act (M.G.L. Ch. 131, § 40; the "Act") and its implementing regulations (310 CMR 10.00 *et seq.*; the "Regulations"); and (2) the U.S. Clean Water Act (i.e., Section 404 and 401 wetlands). Arthur Allen, CPSS, CWS, CESSWI conducted the inspection.

The subject site consists of an approximately 8.34-acre property with a single-family house and several outbuildings. The majority of the site is upland including overgrown, partially open areas and relatively undisturbed, wooded areas. The wetland resources observed on the site are described below.

Methodology

The site was inspected, and areas suspected to qualify as wetland resources were identified. No Bordering Vegetated Wetlands or Waterways were identified on the site. An Isolated Vegetated Wetland ("IVW") was identified on the site. The boundary of IVW was delineated in accordance with Federal criteria including the 1987 "Corps of Engineers Wetlands Delineation Manual" (Department of the Army, Technical Report Y-87-1), the 2012 "Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region (Version 2.0)" (U.S. Army Corps of Engineers - Wetlands Regulatory Assistance Program) and the 2016 "Field Indicators of Hydric Soils in the United States: A Guide for Identifying and Delineating Hydric Soils, Version 8.0" (U.S Dept. of Agriculture, Natural Resources Conservation Service in cooperation with the National Technical Committee for Hydric Soils). The plant taxonomy used in this report is based on the *National List of Plant Species that Occur in Wetlands: Massachusetts* (Fish and Wildlife Service, U.S. Department of the Interior, 1988). Hydrology, soil and vegetation descriptions, recorded at a sampling transect, can be found on the attached US Army Corps of Engineers Wetland Determination Data Forms.

Findings

Wetland A consists of an Isolated Vegetated Wetland ("IVW") located in the northeasterly corner of the site. Wetland A is associated with a seasonal ponding area. Plant species observed

include red maple (*Acer rubrum*) trees and saplings; highbush blueberry (*Vaccinium corymbosum*), sweet pepperbush (*Clethra alnifolia*), buttonbush (*Cephalanthus occidentalis*), cinnamon fern (*Osmunda cinnamomea*) and sensitive fern (*Onoclea sensibilis*). Evidence of wetland hydrology, including hydric soils, high groundwater, and saturated soils were observed within the delineated wetland. Isolated wetlands are not regulated under the Act unless they qualify as Isolated Land Subject to Flooding ("ILSF"). ILSF is present if the wetland has the potential to hold at least ¼ acre-foot of water, to a depth of at least 6 inches. Engineering calculations are required to confirm the presence or absence of ILSF. If ILSF were present, the boundary would fall within the delineated IVW. A 100-foot Buffer Zone extends horizontally outward from the edge of Isolated Vegetated Wetlands under the Wayland Wetland Bylaw. There is no Buffer Zone associated with ILSF under the Act.

Bordering Land Subject to Flooding is an area that floods due to a rise in floodwaters from a bordering waterway or water body. Where flood studies have been completed, the boundary of Bordering Land Subject to Flooding is based upon flood profile data prepared by the National Flood Insurance Program. Section 10.57(2)(a)3. states that "The boundary of Bordering Land Subject to Flooding is the estimated maximum lateral extent of flood water which will theoretically result from the statistical 100-year frequency storm." The project engineer should evaluate the most recent National Flood Insurance Program flood profile data to confirm the absence of Bordering Land Subject to Flooding on the site. Bordering Land Subject to Flooding would occur in areas where the 100-year flood elevation is located outside of or upgradient of the delineated Bordering Vegetated Wetlands or Bank boundary. Bordering Land Subject to Flooding does not have a Buffer Zone under the Act.

The Massachusetts Rivers Protection Act amended the Act to establish an additional wetland resource area: Riverfront Area. Based upon a review of the current USGS Map (attached), there are no mapped streams on or within 200-feet of the site. Furthermore, based upon observations made during the site inspection, there no unmapped streams located on within 200 feet of the site. Accordingly, except as noted above, Riverfront Area would not occur on the site. Riverfront Area does not have a Buffer Zone under the Act, but may overlap other wetland resources and their Buffer Zones.

The Regulations require that no project may be permitted that will have any adverse effect on specified habitat sites of rare vertebrate or invertebrate species, as identified by procedures set forth at 310 CMR 10.59. Based upon a review of the *Massachusetts Natural Heritage Atlas*, 14th edition, Priority Habitats and Estimated Habitats from the NHESP Interactive Viewer, valid from August 1, 2017, and Certified Vernal Pools from MassGIS, there are no Estimated Habitats [for use with the Act and Regulations (310 CMR 10.00 *et seq.*)], Priority Habitats [for use with Massachusetts Endangered Species Act (M.G.L. Ch. 131A; "MESA") and MESA Regulations (321 CMR 10.00 *et seq.*)], or Certified Vernal Pools on or in the immediate vicinity of the site. A copy of this map is attached. There are also no mapped Potential Vernal Pools on the site. The IVW wetland has seasonal ponding characteristics although it was observed to be nearly dry at the time of my site visit on May 14th. This observation indicates that the hydroperiod of the IVW is

EcoTec, Inc.

Wetland Report – 27 Sherman's Bridge Rd., Wayland, MA May 28, 2021 (Revised July 29, 2021) Page 3.

too short to facilitate successful reproduction of vernal pool species. Therefore, the IVW is likely not a functional vernal pool.

The reader should be aware that the regulatory authority for determining wetland jurisdiction rests with local, state, and federal authorities. A brief description of my experience and qualifications is attached. If you have any questions, please feel free to contact me at any time.

Cordially, ECOTEC, INC.

Arthur Allen, CPSS, CWS, CESSWI Vice President Soil & Wetland Scientist

Arthur Allen is the Vice President of EcoTec, Inc. and has been a senior environmental scientist there since 1995. His work with EcoTec has involved wetland delineation, wildlife habitat evaluation, environmental permitting (federal, state and local), environmental monitoring, expert testimony, peer reviews, contaminated site assessment and the description, mapping and interpretation of soils. His clients have included private landowners, developers, major corporations and regulatory agencies. Prior to joining EcoTec, Mr. Allen mapped and interpreted soils in Franklin County, MA for the U.S.D.A. Natural Resources Conservation Service (formerly Soil Conservation Service) and was a research soil scientist at Harvard University's Harvard Forest. Since 1994, Mr. Allen has assisted the Massachusetts Department of Environmental Protection and the Massachusetts Association of Conservation Commissions as an instructor in the interpretation of soils for wetland delineation and for the Title V Soil Evaluator program.

Mr. Allen has a civil service rating as a soil scientist, an undergraduate degree in Natural Resource Studies and a graduate certificate in Soil Studies. His work on the Franklin County soil survey involved interpretation of landscape-soil-water relationships, classifying soils and drainage, and determining use and limitation of the soil units that he delineated. As a soil scientist at the Harvard Forest, Mr. Allen was involved in identifying the legacies of historical land-use in modern soil and vegetation at a number of study sites across southern New England. He has a working knowledge of the chemical and physical properties of soil and water and how these properties interact with the plants that grow on a given site. While at Harvard Forest he authored and presented several papers describing his research results which were later published. In addition to his aforementioned experience, Mr. Allen was previously employed by the Trustees of Reservations as a land manager and by the Town of North Andover, MA as a conservation commission intern.
